Langkah Praktikum:

Setting react app dan firebase

firebase init

Woohoo!

Firebase CLI Login Successful

You are logged in to the Firebase Command-Line interface. You can immediately close this window and continue using the CLI.

4. Pilih setting untuk firebase nya firebase dan Hosting

```
Are you ready to proceed? Yes

Which Firebase CLI features do you want to set up for this folder? Press Space to select features, then Enter to confir my your choices.

() Database: Configure Firebase Realtime Database and deploy rules

(S) Firestore: Deploy rules and create indexes for Firestore

() Functions: Configure and deploy Cloud Functions

(S) Hosting: Configure and deploy Firebase Hosting sites

() Storage: Deploy Cloud Storage security rules

() Storage: Deploy Cloud Storage security rules

() Emulators: Set up local emulators for Firebase features

() Remote Config: Get, deploy, and rollback configurations for Remote Config
```

5. Pilih build jangan pilih Do not choose public

6. Pilih

```
| shart file should be used for Firestore indexes? firestore.indexes.json

**** Horting Setup

Your public directory is the folder (relative to your project directory) that
dill contain noting assets to be uploaded with firebase deplay. If you
have a build process for your assets, use your build's cotput directory.

**Hart do you want to use as your public directory public

**Configure as a single-page ago (rewrite all unis to /index.html) Yes

**Configure as a single-page ago (rewrite all unis to /index.html) Yes

**Tits public/index.html all-mady exists. Overnitar Yes

**Interest public/index.html all-mady exists. Overnitar Yes

                                                               logoutError: false,
                 isLoggingIn: false,
                 isLoggingOut: false,
                 isVerifying: false,
                                                            case LOGOUT SUCCESS:
                 loginError: false,
                 logoutError: false,
                                                               ...state,
                 isAuthenticated: false,
                                                                isLoggingOut: false,
                                                               isAuthenticated: false,
        20
                 user: {},
               action
             ) => {
   switch (action.type) {
                case LOGIN REQUEST:
                                                             return {
                    ...state,
                                                               isLoggingOut: false,
                     isLoggingIn: true,
                                                               logoutError: true,
                    loginError: false,
                 case LOGIN_SUCCESS:
                                                            case VERIFY REQUEST:
                  return {
                    ...state,
                    isLoggingIn: false,
                                                                isVerifying: true,
                    isAuthenticated: true,
                                                               verifyingError: false,
                    user: action.user,
                                                               ...state,
                                                               isVerifying: false,
2.
      Edit reducers/index.js
          src > reducers > JS index.js > ...
                     import { combineReducers } from "redux";
                     import auth from "./auth";
                     export default combineReducers({ auth });
              4
3.
      Setting Redux plumbing
```

4. Pilih src folder called configureStore.js dan edit

```
src > 15 configureStorejs > ...

1   import { applyMiddleware, createStore } from "redux";

2   import thunkMiddleware from "redux-thunk";

3   import { verifyAuth } from "./actions/";

4   import rootReducer from "./reducers";

5   export default function configureStore(persistedState) {

7   const store = createStore(

8   rootReducer,

9   persistedState,

10   applyMiddleware(thunkMiddleware)

11   );

12   store.dispatch(verifyAuth());

13   return store;

14  }

15
```

5. Pilih dan edit folder src dan root.js

6. Pilih dan edit folder src/index.js

```
src > J5 indexjs

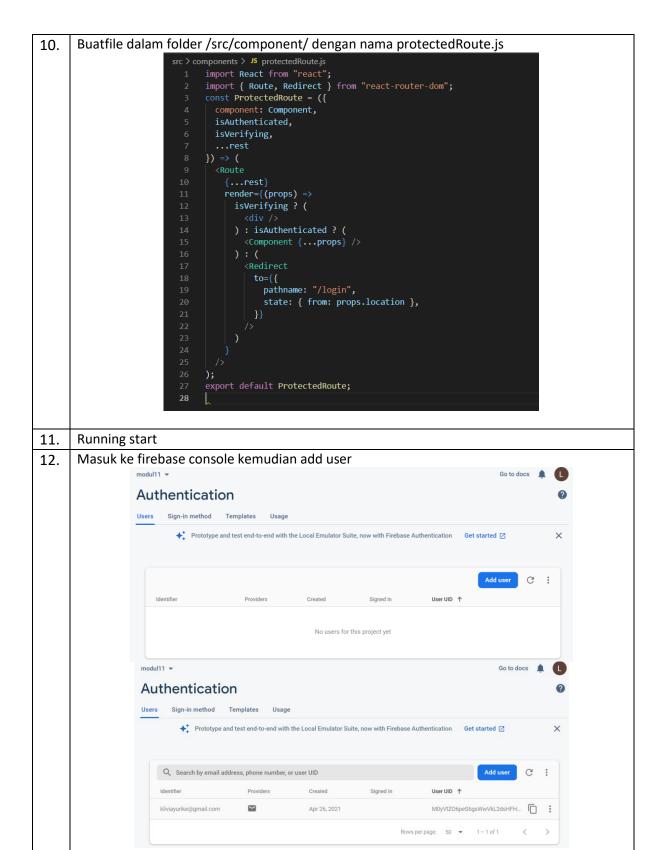

1    import React from "react";
2    import ReactDOM from "react-dom";
3    import Root from "./Root";
4    import * as serviceWorker from "./serviceWorker";
6    ReactDOM.render(<Root />, document.getElementById("root"));
7    // If you want your app to work offline and load faster, you can change
8    // unregister() to register() below. Note this comes with some pitfalls.
9    // Learn more about service workers: https://bit.ly/CRA-PWA
serviceWorker.unregister();
11
```

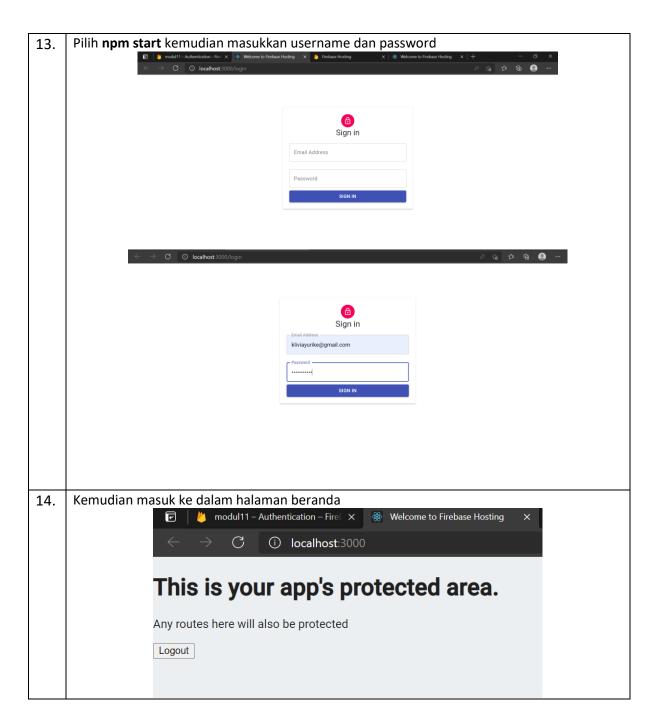

7. Buat lah coding App.js

```
Buatlah file dan simpan components/Login.js
8.
                                                                    import React, { Component } from "react";
                                                                   import React, { Component } from "react";
import { connect } from "react-redux";
import { Redirect } from "react-router-dom";
import { loginUser } from "../actions";
import { withStyles } from "@material-ui/styles";
import Avatar from "@material-ui/core/Avatar";
import Button from "@material-ui/core/Avatar";
import Button from "@material-ui/core/CovtField
                                                                   import TextField from "@material-ui/core/TextField";
import LockOutlinedIcon from "@material-ui/cons/LockOutlined";
import Typography from "@material-ui/core/Typography";
                                                                   import Paper from "@material-ui/core/Paper";
import Container from "@material-ui/core/Container";
                                                                   const styles = () => ({
                                                                                  body: {
                                                                                         backgroundColor: "#fff"
                                                                           paper: {
                                                                                  marginTop: 100,
                                                                                  display: "flex",
                                                                                  padding: 20,
